(a) mass of the fermions in vacuum
mass = cutoff: end of the effective theory
D = 7
D = 4
D = 3
bare mass 0
bare mass 0.05 Λ
mass in vacuum m_{vac}/Λ
deflation clock, counted from $G_S = G_c$
(b) the example with the filled sea
cutoff of the sea
no sea
$\Lambda = 0.30\, m_{vac}$
$\Lambda = 0.45\, m_{vac}$
$\Lambda = 0.60\, m_{vac}$
$\varepsilon/n - m_{vac}$ (units m_{vac})
Fermi momentum k_F/m_{vac}
