lunar laser ranging: $\dot{G}_N/G_N$
(needs eight-dimensional gravity, A2)
0.0032
nucleosynthesis: G_N
(needs A2)
0.064
microwave background, mock data (forecast):
Planck-like, and with a deep survey (needs A2)
0.021 to 0.038
nucleosynthesis: Fermi constant
(needs the assumption HV)
0.11 to 0.23
atomic clocks: proton-electron mass ratio
(the hypothesis H2, for $n_{EW} = 1$)
1.2×10^{-6}
atomic clocks: $\dot{\alpha}/\alpha$
(only if electromagnetism were eight-dimensional;
not part of the model)
4.6×10^{-8}
10^{-9}
10^{-7}
10^{-5}
10^{-3}
10^{-1}
10^{1}
upper bound on the present rate of deflation, gsum / H_0 (allowed region to the left)
