(a) can the paired state follow?
slow: $10^{-4}\,E_{sh}$
fast: gsum $= 0.1\,E_{sh}$
$|\Delta|/\Delta_{eq}(\lambda)$
pairing strength $\lambda \propto e^{\tau_d}$
(b) how far it falls behind
smallest $|\Delta|/\Delta_{eq}$
rate of deflation gsum / E_{sh}
(c) what the lag leaves behind
broken pairs at $\lambda = 0.5$
gsum / E_{sh}
